**OVERVIEW**

Compared with state and national statistics, the incidence of rabies disease within Clinton County is low. However, because rabies is fatal, the disease continues to pose a significant threat to our community. Ongoing efforts to stop the spread of rabies are necessary to keep our community safe and healthy.

The rabies virus infects wildlife, especially bats, raccoons, skunks and foxes. Rabies is transmitted from the saliva of an infected animal, and can spread to people and pets when they are bitten or scratched, causing fever, agitation and death. The virus is **100% preventable** with post-exposure prophylaxis (PEP) that includes rabies vaccine and medications to fight infection, as long as people get PEP before symptoms start.

Understanding the risk and knowing what to do after contact with wildlife or being bitten by a domestic animal can save lives.

The Clinton County Health Department (CCHD) leads local efforts to control rabies. The Rabies Prevention Program involves both CCHD’s Divisions of Environmental Health & Safety (EHS) and Health Care Services (HCS). Program staff follow State Public Health Law to investigate animal bite reports, facilitate testing of animal specimens for rabies, provide pet rabies vaccination clinics, offer rabies prevention education to the community, and recommend and administer PEP for exposed persons. In addition, the United States Department of Agriculture (USDA) conducts regional oral vaccination bait drops, as part of the National Rabies Management Program.

**Animals Tested for Rabies Virus**

- 614 animals were tested for rabies.
- 12 of those tested were positive for rabies.
- 50% of animals testing positive for rabies were bats, followed by skunks and raccoons.
- In 2018, 1 dog tested positive for rabies.

Nationally, 4.8% of animals tested in 2017 were positive for rabies; 91% of these were rabid wildlife. In NYS (excluding NYC), 5.3% (329) of animals tested in 2018 (6,209) were positive for rabies.

**Post-exposure Prophylaxis (PEP)**

Nationally, about 55,000 Americans receive PEP each year, at an average cost of $3,800 per person (not including costs for hospital treatment or wound care).

---

Preventing rabies exposure in domestic pets through vaccination is vital to reducing the chance of rabies exposure in humans. Dogs, once the leading cause of human rabies deaths in the US, now account for only 1% of rabid animals reported each year.

To increase vaccination rates of pets in Clinton County, CCHD offers free rabies clinics to residents. Several clinics are held each year at varied locations throughout the county. A schedule of clinics is available at www.clintonhealth.org/rabiesclinics.

CCHD administered 1,523 rabies vaccines in 2018.

A large-scale effort to control rabies in wildlife known to carry the disease is led by the USDA’s Animal and Plant Health Inspection Service (APHIS). The national wildlife vaccination program scatters ORV baits in targeted areas across the US, including parts of Clinton County.

In Clinton County, high numbers of raccoons make it more likely that a human, a pet or farm animal will encounter a rabid raccoon. Use of ORV has helped control raccoon rabies in our community.

Education is a key component of rabies prevention efforts. Understanding the risk for rabies transmission and the need for timely administration of PEP to prevent death is critical. For example, bites and scratches from bats can be very small and can often go unnoticed. In addition, if a bat is found in a home, catching and testing it can prevent potentially unnecessary PEP and associated costs. Many education messages also focus on the importance of vaccinating pets against rabies. CCHD’s website offers links to current information on rabies from the CDC and local rabies clinics, but the department shares rabies education using many approaches.

In 2018, more than 171,000 ORV baits were distributed by airplane and vehicle throughout areas of Clinton County.

In 2018, rabies messages were delivered through:

- 2 media releases
- 300+ Summer Safety Guides
- 1 radio interview
- 43 social media messages

Residents
- Leave all wildlife alone, including bats, raccoons, foxes, skunks and feral cats.
- Vaccinate your pets and livestock to protect them and your family.
- If you are bitten by a domestic animal, get the owner’s contact information and seek medical care.
- If you find a bat in your house, safely capture it and call CCHD.
- If you are bitten, scratched, or unsure, talk to the CCHD or a health care provider about whether you need PEP.
- Do not attract wildlife by leaving pet food outdoors.

Healthcare Professionals
- Educate patients on rabies prevention, prompt notification of an animal bite or potential rabies exposure, and the need for timely PEP.
- Notify CCHD immediately if a patient is bitten by a wild or domestic animal.
- Encourage patients to vaccinate their pets.
- Instruct patients to avoid contact with all animals when traveling internationally and to seek medical care immediately if they are bitten or scratched.

Community Leaders
- Support programs to increase rabies vaccination rates of domestic pets and wildlife, such as rabies clinics and ORV bait drops.
- Communicate and work with leaders across jurisdictional borders to maintain awareness of current rabies related activity.
- Review state and federal issued reports on rabies patterns.
